## Transport solution doors in DRAGON5

A transport solution **door** is a **generic API** permitting to solve

- a single **monoenergetic** or
- a set of  $G$  independent **monoenergetic** Boltzmann transport equations (BTE).

The following doors are available:

**SYBILT()**, **SYBILA()**, **SYBILP()**, **SYBILF()** Collision probability method in 1D and interface current method in 2D

**EXCELT()**, **EXCELP()** Collision probability method in Cartesian (2D/3D) or hexagonal 2D.

**NXT()** Collision probability method (new generation) in Cartesian (2D/3D) or hexagonal (2D/3D).

**SALT()** Collision probability method (new generation) in general 2D surfacic geometry.

**MCCGT()**, **MCCGA()**, **MCCGF()** Method of characteristics (MOC) software adaptor for **EXCELL**, **NXT** or **SALT** doors.

**SNT()**, **SNF()** Method of discrete ordinates (SN) in 1D, R-Z (2D) or regular Cartesian geometry (2D,3D).

### Transport solution doors in DRAGON5

The interface current method with SYBILT

The collision probability method with NXT

The method of characteristics with NXT

The collision probability method with SALT

The discrete ordinates method with SNT

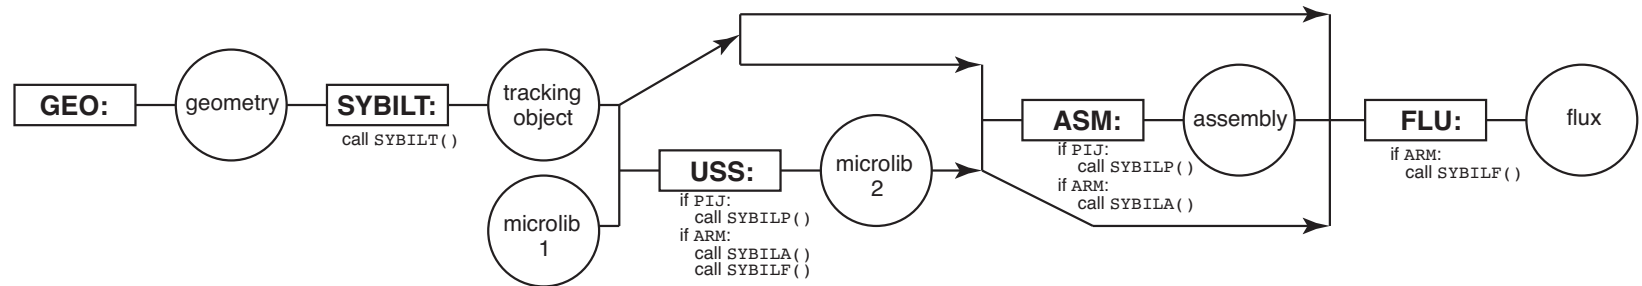

Datasets

# The interface current method with SYBILT

- The interface current (IC) method is an **approximate** solution technique of the BTE. Implemented in **SYBIL** doors.
- The fuel assembly (Cartesian or hexagonal) is divided in pincells
  - ◆ 2D collision probabilities are computed over each pincell
  - ◆ Pincells are coupled using  $DP_0$  and  $DP_1$  currents between them
- IC method is recommended for performing **resonance self-shielding** calculations over PWR assemblies
- IC method is used to obtain the solution of the BTE
  - ◆ as the main solution technique in previous-generation computational schemes ( $\approx 1995$ )
  - ◆ as the solution technique for the **first level** in today's two-level schemes
- Two solution techniques:
  - PIJ**: Build a full collision probability matrix for the assembly
  - ARM**: Perform a flux-current iteration in each energy groups

# The interface current method with SYBILT

The dataflow of a DRAGON5 dataset with SYBIL looks like

The corresponding dataset is

```

GEOM := GEO: :: CARCEL 6
  X- REFL X+ REFL      Y- REFL Y+ REFL
MESHX 0.0 1.2  MESHY 0.0 1.2
RADIUS 0.0 0.288712 0.365195 0.397962
        0.4083 0.45 0.5748331
MIX 1 2 3 4 5 6 7 ;
TRACK := SYBILT: GEOM ::
  MAXR 20 QUA2 20 3 ;
LIBRARY2 := USS: LIBRARY TRACK ::
  EDIT 1 TRAN PASS 2 PIJ ;
ASB := ASM: LIBRARY2 TRACK :: PIJ ;
FLUX := FLU: LIBRARY2 TRACK ASB :: TYPE K ;
  
```

The collision  
probability method  
with NXT  
The method of  
characteristics with  
NXT  
The collision  
probability method  
with SALT  
The discrete ordinates  
method with SNT  
Datasets

# The collision probability method with NXT

- The collision probability (PIJ) method is a solution technique of the BTE. Implemented in **SYBIL** (1D only), **EXCEL**, **NXT** and **SALT** doors
- **NXT** provides the latest implementation of the CP method in 2D/3D Cartesian/hexagonal geometries
- Two types of boundary conditions:
  - TISO** Finite tracks (VOID, ALBE or REFL-white BCs)
  - TSPC** Cyclic tracks (TRAN, SYME or REFL-specular BCs)
- A **tracking file** in sequential binary format is produced

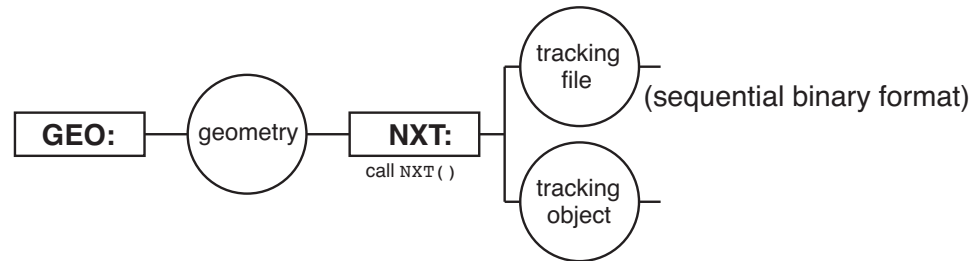

Finite tracks

Cyclic tracks

# The collision probability method with NXT

The dataflow of a DRAGON5 dataset with **NXT** looks like

The corresponding dataset is

```

GEOM := GEO: :: CARCEL 6
  X- REFL X+ REFL      Y- REFL Y+ REFL
MESHX 0.0 1.2  MESHY 0.0 1.2
RADIUS 0.0 0.288712 0.365195 0.397962
        0.4083 0.45 0.5748331
MIX 1 2 3 4 5 6 7 ;
TRACK TRKFL := NXT: GEOM ::
  TISO 20 15.0 ;
LIBRARY2 := USS: LIBRARY TRACK TRKFL ::
  EDIT 1 TRAN PASS 2 PIJ ;
ASB := ASM: LIBRARY2 TRACK TRKFL :: PIJ ;
FLUX := FLU: LIBRARY2 TRACK ASB :: TYPE K ;
  
```

# The collision probability method with NXT

It is possible to **avoid** computing a tracking file and to compute the track lengths **on demand** during the calculation of the PIJ matrices. This option (**XCLL**) increases the CPU time required to compute the PIJ matrices.

The corresponding dataset is

```

GEOM := GEO: :: CARCEL 6
  X- REFL X+ REFL      Y- REFL Y+ REFL
MESHX 0.0 1.2  MESHY 0.0 1.2

Datasets

- The method of characteristics (MOC) is a solution technique of the BTE. Available with `EXCELT()`, `NXT()` and `SALT()` doors
- The MOC offers an alternative solution technique to the PIJ method, with the following characteristics
  - ◆ Full  $N \times N$  matrices (if  $N$  regions) are **never** computed
  - ◆ Scattering anisotropy of the neutron sources can be taken into account
  - ◆ Discontinuous-linear neutron source distributions can be taken into account
  - ◆ Scattering reduction of the **monoenergetic** BTE is not possible and inner iterations must be implemented with
    - acceleration with the GMRes algorithm
    - preconditionning with a simplified transport operator
- Doors `MCCGT()`, `MCCGA()` and `MCCGF()` are used in addition to `NXT()`

Datasets

- The **SALT** door provides another implementation of the PIJ and MOC solutions for the BTE.
- SALT implements a **general 2D geometry model** based on a **surfacic representation**. Any 2D geometry is seen as a collection of **surfacic nodes** of three types:
  - ◆ straight line segment
  - ◆ arc circles
  - ◆ full circles
- Introduced in the Ph.D. thesis of N. Lyoussi-Charrat, CEA, 1994
- A first module **G2S**: produces the **surfacic file** and a second module **SALT**: perform the tracking of this surfacic file
- Module **SALT**: is largely based on the internal API of the **NXT**: module
- The **surfacic file** can also be produced using the SALOME platform with the help of a Python plugin
- Windmill discretization of the Cartesian pincells are expected in DRAGON V5.0.2.

# The collision probability method with SALT

The dataflow of a DRAGON5 dataset with **SALT** looks like

The corresponding dataset is

```

GEOM := GEO: :: CARCEL 6
  X- ALBE 1.0 X+ ALBE 1.0      Y- ALBE 1.0 Y+ ALBE 1.0
  MESHX 0.0 1.2  MESHY 0.0 1.2
  RADIUS 0.0 0.288712 0.365195 0.397962
           0.4083 0.45 0.5748331
  MIX 1 2 3 4 5 6 7 ;
Fil_SAL.dat Fil_SAL.ps := G2S: GEOM :: DRAWNOD ;
TRACK TRKFL := SALT: Fil_SAL.dat ::
  TISO 20 15.0 ;
LIBRARY2 := USS: LIBRARY TRACK TRKFL ::
  EDIT 1 TRAN PASS 2 PIJ ;
ASB := ASM: LIBRARY2 TRACK TRKFL :: PIJ ;
FLUX := FLU: LIBRARY2 TRACK ASB :: TYPE K ;
  
```

# The collision probability method with SALT

The surfacic and postscript files are declared as

```
SEQ_ASCII Fil_SAL.dat ;  
SEQ_ASCII Fil_SAL.ps :: FILE './Fil_SAL.ps' ;
```

The postscript file generated by **G2S**: follows:

Transport solution  
doors in DRAGON5

Datasets

- The **discrete ordinates** (or SN) method is available in DRAGON5. The basic implementation is the **diamond differencing** (DD) scheme with **no negative fixup**.
- Solution is possible in
  - ◆ 1D slab, cylindrical and spherical geometries
  - ◆ RZ regular geometry
  - ◆ 1D/2D/3D regular Cartesian geometries
- **High order diamond differencing** (HODD) schemes are available in Cartesian geometries.
- Scattering anisotropy of the neutron sources can be taken into account
- A choice of angular quadratures is available, including **level symmetric** and **product** quadratures.
- Pincell geometries **cannot** be represented. Cylinderization is required.
